### Commonwealth of Kentucky Division for Air Quality

### PERMIT STATEMENT OF BASIS

CONDITIONAL MAJOR (DRAFT PERMIT) NO. F-06-020 MARATHON PETROLEUM COMPANY LLC 230 EAST 33<sup>RD</sup> STREET, COVINGTON, KENTUCKY JUNE 1, 2006 IL-WON SHIN, REVIEWER

SOURCE I.D. #: 021-117-00022

SOURCE A.I. #: 2479

ACTIVITY #: APE20050004

#### **SOURCE DESCRIPTION:**

Marathon Petroleum Company LLC (MPC) owns and operates a terminal in Covington, Kentucky. The terminal receives product by barge, stores the product in tanks, and then loads the product to tank trucks for distribution. The terminal is currently permitted under Kentucky air operating permit S-01-031.

Operating permit S-01-031 was issued to the terminal in 2001. On September 9, 2005, MPC submitted letters to the Division requesting the addition of alternate control devices for the terminal. MPC also submitted a new application on January 9, 2006. In addition, MPC submitted a New Source Performance Standard (NSPS) "Reconstruction" Notification for Tank 324 and NSPS Modification Determination for Tank 29-320 on February 27, 2006. Corrected distillate loading emission factors and the insignificant activity of pump modification were submitted on April 20, 2006 and May 12, 2006, respectively. At this time, MPC is requesting a completely updated conditional major air permit for the Covington terminal.

The Covington Terminal is a bulk storage facility that receives gasoline, fuel oil, and kerosene by barge and stores the products in above ground storage tanks (note that jet fuel is considered a subset of kerosene). Occasionally, a tank truck loaded with gasoline or other product may be returned and off-loaded into a storage tank. However, this is not a routine operation. Ethanol, additives, and diesel dye are received by tanker truck and are injected into the product at the loading racks. All products are shipped out by tank trucks, which are loaded at the loading racks. This terminal also has the capability of off-loading to barges in cases of emergencies. This backloading is not a routine operation at the Covington Terminal.

Covington consists of three loading racks. The North (#1) loading rack consists of two bottom-loading bays that are vented to a vapor recovery unit. The South (#2) loading rack consists of two uncontrolled top-loading bays, and the East (#3) loading rack consists of one uncontrolled top-loading bay. The South and East racks are to be converted to uncontrolled bottom loading racks in 2006 or 2007. Gasoline is loaded at the North rack, but not the South or East. The table below outlines the future changes to the loading racks at the Covington Terminal.

# Statement of Basis MARATHON PETROLEUM COMPANY LLC Page 2 of 5

**Table: Future Changes to the Covington Loading Racks** 

Emission Point	Loading Rack	Current Configuration	Future Configuration	Comments
013	North (#1) two- lane loading rack	Bottom loading vented to the VRU	Bottom loading vented to the VRU	No change expected
014	South (#2) two- lane loading rack	Top loading no controls	Bottom loading no controls	
015	East (#3) two- lane loading rack	Top loading no controls	Bottom loading no controls	

The facility also has small oil-water separators and other miscellaneous equipment.

A vapor recovery unit (VRU) is the primary control for the North (#1) loading rack. Vapors vented during loading are adsorbed onto an activated carbon bed. When the bed becomes saturated, it is regenerated. Regeneration is achieved by absorbing the recovered gasoline vapors off of the beds with liquid gasoline. The VRU has two beds. One carbon bed removes gasoline vapors while the other bed is being regenerated. After a period of time, the beds will switch.

On occasion the VRU may need to be down for maintenance. Because emissions control is required by 40 CFR 60 Subpart XX, Marathon has the ability to use backup control devices in order to eliminate long term interruptions of terminal loading operations. The Covington Terminal has one backup emission control device. The backup emission control is portable vapor combustion units (VCU) owned by Marathon. Marathon owns several of these portable oxidizers, which are regularly tested and maintained by the company for use as backup emission controls at their terminals. The September 9, 2005 letter from Marathon to the Division included documentation that these units will also meet the Subpart XX control requirements.

#### **COMMENTS:**

#### Type of control and efficiency:

- A vapor recovery unit (VRU) is the primary control for North (#1) loading rack emissions with 99.88% efficiency.
- The backup emission control is portable vapor combustion units (VCU).

#### Emission factors and their source:

MPC has calculated maximum emissions from the terminal using estimated future maximum throughputs. Maximum product throughputs were estimated using predicted future maximum market demands, and then increased by a substantial safety factor to give conservative estimates. Tank emissions calculations are performed by the TANK 4.0 software program. Loading rack totals are based on VRU stack test results for gasoline and AP-42 for fuel oil.

# Statement of Basis MARATHON PETROLEUM COMPANY LLC Page 3 of 5

#### Applicable regulations:

- 40 CFR 60 Subpart XX, Standards of Performance for Bulk Gasoline Terminals. Per Section 60.500(a), this rule applies to gasoline loading to gasoline tank trucks. It does not apply to barge loading. Gasoline is only loaded at the North (#1) loading rack. The rule limits loading emissions to less than 35 mg/l of gasoline loaded. A compliance test was performed on October 19, 2001, which demonstrated compliance. The test indicated a 1.5 mg/l emission rate.
- 40 CFR 60 Subpart Kb, Standards of Performance for Volatile Organic Liquid Storage Vessels (Including Petroleum Liquid Storage Vessels) for Which Construction, Reconstruction, or Modification Commenced After July 23, 1984. Per Section 60.110b(a), the rule applies to storage vessels with capacities greater than 75 m³ (19,800 gal) that are used to store volatile organic liquids, and that commenced after July 23, 1984. Also, Section 60.110b(b) of the rule exempts storage vessels with a capacity greater than or equal to 151 m³ (39,890 gal) storing a liquid with a maximum true vapor pressure less than 3.5 kPa or with a capacity greater than or equal to 75 m³ but less than 151 m³ storing a liquid with a maximum true vapor pressure less than 15.0 kPa. Several tanks at the terminal are subject to the emission control requirements of the rule. These tanks use internal floating roofs to achieve compliance.
- 401 KAR 59:050, *New storage vessels for petroleum liquids*. Because Kenton County was designated as ozone not-attainment, under Section 1(1) and 1(2) of the rule a tank could be subject to the rule if its capacity is greater than 580 gallons, it is used to store petroleum liquids not including fuel oils #2 #6, gas turbine fuel oils #2GT #4GT, and diesel fuel oils #2D #4D, and is either:
  - 1. Less than 40,000 gallons and commenced between April 9, 1972 and July 24, 1984.
  - 2. Less than 10,567 gallons and commenced after July 24, 1984.
  - 3. Greater than 40,000 gallons and commenced between April 9, 1972 and July 24, 1984.

Tanks 330 and 338, insignificant additive tanks 336, 340, 341, 343, 344, and insignificant used motor oil tank HA-1-2 fall into the second category. Under Section 3(2), any of these tanks storing liquids with a maximum true vapor pressure greater than 1.5 psi are required to have a permanent submerged fill pipe. Distillate/kerosene/diesel and used motor oil have maximum true vapor pressures well below 1.5 psi. Therefore, tanks 330 and HA-1-2 have no requirements under the rule.

401 KAR 61:050, *Existing storage vessels for petroleum liquids*. Because Kenton County was designated as ozone not-attainment, under Section 2(1) of the rule a tank could be subject to the rule if its capacity is greater than 580 gallons, it commenced before April 9, 1972, and it is used to store petroleum liquids not including fuel oils #2 - #6, gas turbine fuel oils #2GT - #4GT, and diesel fuel oils #2D - #4D.

Tanks 319, 321, 322, and 331 are subject to the rule. Under Section 3(1) of the rule, tanks with capacities greater than 40,000 gallons storing liquids with maximum true vapor pressures greater than 1.5 psi and less than 11.1 psi are required to be equipped with a floating roof. Gasoline tanks 319 and 321 are subject to these requirements. Under Section 3(3) of the rule,

# Statement of Basis MARATHON PETROLEUM COMPANY LLC Page 4 of 5

tanks storing liquids with a maximum true vapor pressure greater than 1.5 psi are required to have a permanent submerged fill pipe. This applies to all of the above tanks except Tank 322, since distillate/kerosene/diesel have maximum true vapor pressures well below 1.5 psi. Therefore, tank 322 has no requirements under the rule.

#### Regulations not applicable:

- 40 CFR 63 Subpart R, *National Emission Standards for Gasoline Distribution Facilities*. Per Section 63.420(a)(2) of the rule, the regulation applies only to facilities that are part of a major source of HAP emissions. The terminal is a minor HAP source, since maximum HAP emissions are significantly less than 22.5 ton/yr total HAP and 9 ton/yr individual HAP. Therefore, the rule does not apply.
- 40 CFR 63 Subpart Y, *National Emission Standards for Marine Tank Vessel Loading Operations*. The marine vessel loading operations are not an affected source as defined at 40 CFR 63.561. Section 40 CFR 63.561 defines sources with emissions less than 10 and 25 tons to be major sources with HAP emissions from marine tank vessel loading operations less than 10 and 25 tons. The terminal is not a major source of HAP. Also, pursuant to 40 CFR 63.560 Section (b)(2), sources with aggregate marine tank vessel loading throughputs less than 10 million barrels of gasoline annually and less than 200 million barrels of crude oil annually are not subject to the rule. Barge back-loading at the terminal is not a routine operation, and these throughput levels will never be approached.
- 401 KAR 59:101, *New bulk gasoline plants*, and 401 KAR 61:056, *Existing bulk gasoline plants*. These rules apply to facilities that use tank trucks, trailers, or other mobile non-marine vessels for both incoming and outgoing gasoline transfers. The Covington terminal receives its gasoline supply by pipeline. Therefore, these rules do not apply. (Note that occasionally a tank truck loaded with gasoline or other product at the terminal is returned to the terminal for off-loading, but pipeline is the sole source of the terminal's gasoline supply).
- 401 KAR 61:055, Existing loading facilities at bulk gasoline terminals. This rule does not apply since the gasoline loading rack (North #1 Rack) was commenced after June 29, 1979. Instead, the North #1 Rack is subject to 40 CFR 60 Subpart XX.
- 401 KAR 59:095, New oil-effluent water separators, and 401 KAR 61:045, Existing oil-effluent water separators. Under Section 2(1) of these rules, oil-water separators could be subject to the rule if they recover 200 gallons per day or more of petroleum products. The oil-water separators at the terminal recover significantly less than this amount of petroleum products, and are therefore not subject to the rules.

# Statement of Basis MARATHON PETROLEUM COMPANY LLC Page 5 of 5

#### **EMISSION AND OPERATING CAPS DESCRIPTION:**

In order to ensure that the terminal remains exempt from the regulations applicable to major sources of criteria and hazardous air pollutant (HAP) emissions, including the Gasoline Distribution MACT (40 CFR 63 Subpart R), MPC is requesting a Conditional Major permit. Terminal emissions will be limited to less than 90 ton/yr volatile organic compounds (VOC), 22.5 ton/yr total HAP, and 9 ton/yr individual HAP. Monthly and rolling 12-month total emissions will be calculated. Emission calculations and supporting documentation will be retained at the terminal.

#### **PERIODIC MONITORING:**

See the permit for Specific Monitoring Requirements.

#### **OPERATIONAL FLEXIBILITY:**

None

#### **CREDIBLE EVIDENCE:**

This permit contains provisions which require that specific test methods, monitoring or recordkeeping be used as a demonstration of compliance with permit limits. On February 24, 1997, the U.S. EPA promulgated revisions to the following federal regulations: 40 CFR Part 51, Sec. 51.212; 40 CFR Part 52, Sec. 52.12; 40 CFR Part 52, Sec. 52.30; 40 CFR Part 60, Sec. 60.11 and 40 CFR Part 61, Sec. 61.12, that allow the use of credible evidence to establish compliance with applicable requirements. At the issuance of this permit, Kentucky has only adopted the provisions of 40 CFR Part 60, Sec.60.11 and 40 CFR Part 61, Sec. 61.12 into its air quality regulations.
